

X1 Distributed Discovery™

X1 Distributed Discovery gives legal, compliance and IT teams a fundamentally better and faster way to identify, analyze and act on data in place, at the desktop level, across the organization for eDiscovery, data audit and compliance initiatives.

Built upon X1's patented and award-winning search technology, X1 Distributed Discovery is the only solution that allows organizations to centrally search end-points in minutes or hours instead of weeks or months. With X1 Distributed Discovery, organizations can now process their distributed data in place, on the end-user's machine, without collecting the data back to a central location.

Unique in the industry, X1 Distributed Discovery operates across desktops and laptops, in addition to file servers, cloud repositories, and other enterprise data sources, supporting eDiscovery collections, data audit, cloud migration, public records requests and other compliance needs.

Integrated Data Governance Solution

Respond to eDiscovery collections, data audit and compliance initiatives from a single platform

Blazingly Fast Search Technology

X1's patented search technology centrally searches distributed end-points in minutes, with precision and accuracy

Global Enterprise Scalability

Centrally search enterprise data whether on-premise, in the cloud, on desktops, laptops or other network sources

Early Insight into Data

Gain instant visibility into data residing directly on end-users' computers early in the process

“The ability to instantaneously search for keywords across the enterprise for a small or large group of custodians is in its own right a killer application. This particular feature gives you instantaneous answers to one of the key questions folks have been wrestling with for quite some time.”

Erik Laykin
Managing Director,
Duff and Phelps

About X1

X1 creates exceptional solutions for people and organizations that need to find information, whether on individual desktops, company networks or social media at the fastest speeds in the industry. Powered by patented¹ and award-winning search technology, X1 supports enterprise customers worldwide in both public and private sectors.

X1 Distributed Discovery™ eDiscovery

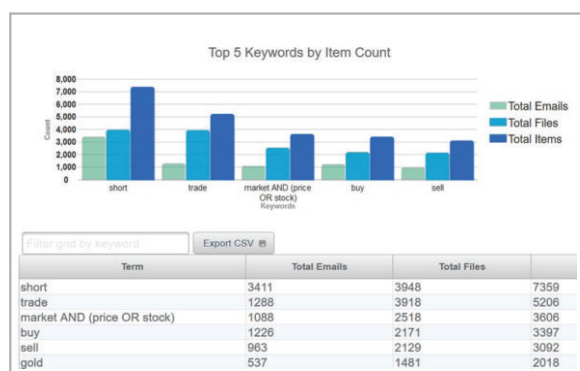

Unique in the industry, X1 Distributed Discovery upends the traditional collection process by analyzing ESI on a custodian's assigned computer on a moment's notice, prior to collection, enabling true early case assessment and focusing collections as precisely as desired.

X1 Distributed Discovery's exceptional architecture makes this unique approach to eDiscovery collections possible. Specifically, the index is located at the end-node, distributed across the enterprise and searchable from a central location.

Now eDiscovery jobs are no longer halted simply because a custodian's machine goes offline or changes networks. The resiliency of the architecture allows searching, identification and preservations to automatically resume.

Instant Keyword Testing

Only with X1's patented technology can legal teams and eDiscovery examiners execute keywords on ESI in place and receive statistics for potential responsiveness in a nearly instantaneous, iterative process, all before collection.

Although other products may instantly search the metadata of files, X1 Distributed Discovery gives examiners instant insight into their data by searching the content of files, emails and attachments in addition to the metadata.

Search within Email Containers on End-Nodes

X1 Distributed Discovery is the only eDiscovery solution that eliminates the need to transfer entire email containers such as PSTs, by allowing the identification and preservation of individual messages in place on a custodian's computer.

Preservations can now be much more targeted, substantially reducing volumes of data collected for review, because indexing, searching and identification takes place at the end-node where harder to access, unstructured data often resides.

X1 Distributed Discovery™ Data Audit & Compliance

X1 Distributed Discovery is the only software that gives organizations the capability to access, analyze and act upon data in just minutes on an individual's computer and company networks for the purpose of complying with internal policies, data audits and regulatory requirements.

For the first time in the industry, organizations can drastically reduce business disruptions by precisely targeting data, and when a project merits it, actually involve users in analyzing their own data to expedite resolution of compliance initiatives.

Instant Data Insight

X1 transforms an organization's existing compliance abilities by providing instant insight into not only the attributes, but also the content of user data, empowering fundamentally faster decisions and resolutions.

Running across targeted machines within just minutes, these searches let organizations know which users have which types of data and how much data is stored.

Ability to Process Email Containers

The search and remediation of individual email messages directly on the end-user's machine is now possible without laborious and time-consuming transfer of the entire PST email container or requiring the deletion of the entire container file.

User Review

X1 Distributed Discovery has created an automated way for an organization's employees to personally review their own data in place and impact its outcome during the compliance audit process, if a project merits it.

X1 brings a first of its kind, centrally managed, and optional data audit review capability to compliance teams. The user's data, subject to audit review, is presented to the user in an intuitive interface for them to review, analyze and designate actions.

Organizations can now significantly minimize the overall impact of data audits by reducing employee disruption and minimizing project management overhead such as auditing, tracking, validation scans or other workflow tasks.
